

App-2-Medical Billing Coding & Revenue Cycle Hub

We are not selling automated medical coding. We are selling instant liquidity and margin recovery.

Value Proposition

- **Reduce Charge Lag from 7.1 Days to Under 24 Hours:** NeuroFlo moves completed operative notes through medical coding to submission-ready charges in less than a day instead of remaining in a multi-day backlog. For a hospital processing **\$5 million per day**, the model equates six days of reduced lag to approximately **\$30 million in working capital**, plus approximately **\$1.5 million in interest/capital savings**.
- **Reduce Claim Denials and Administrative Rework:** NeuroFlo improves first-pass claim quality through better documentation, coding verification, modifiers, and hospital-specific rules. The model applies a **5% reduction in denials across 100,000 claims**, preventing approximately **5,000 reworks** and producing approximately **\$590,000 in administrative savings at \$118 per reworked claim**.
- **Reduce Outsourced Coding Costs:** NeuroFlo helps internal coding teams process more cases with AI-assisted review, reducing reliance on third-party coding agencies. The model assumes **10 external coders at \$80,000 per year**, representing approximately **\$800,000 in annual direct labor savings**.

- **Cut Coding Time from Days to Minutes:** The finalized operative note is translated into CPT, ICD-10, and HCPCS codes, passed through the hospital's custom rules engine, and presented to medical coders for verification in one workflow.
- **Improve First-Pass Claim Accuracy:** The platform is modeled around **95%+ first-pass accuracy**, reducing correction, resubmission, and downstream billing friction.
- **Increase the Value of the Existing Coding Team:** NeuroFlo is designed as a **human-in-the-loop companion**, allowing medical coders to verify and process clean claims faster rather than replacing them, while reducing dependence on outsourced labor.

Problems Solved / Solutions Offered

- **Complete Documentation-to-Coding Workflow:** NeuroFlo bridges the gap between the operative note and the billing department, carrying the intelligence established during documentation directly into medical coding instead of forcing coders to start from a disconnected, incomplete source document.
- **Hospital-Specific Coding Intelligence:** NeuroFlo applies the hospital's own grouping preferences, CPT (Current Procedural Terminology) modifiers, payer-specific policies, administrative requirements, and coding logic while working across CPT, ICD-10, and HCPCS code sets.
- **Source-Linked Human Verification:** Medical coders review AI-suggested codes directly against the highlighted source text in the operative note, giving them the clinical evidence needed to verify each recommendation before approval.
- **Human-in-the-Loop by Design:** NeuroFlo is built as a companion to existing medical coders, not a replacement. The system performs analysis and preparation while qualified coders retain final review and compliance justification.
