

App-3 AI Surgical Insights

We are not selling a dashboard. We are selling surgical data governance and strategic foresight.

Value Proposition

- **Unlock Surgical Data Trapped in Operative Notes:** More than **80% of clinical data is described in the document as trapped in unstructured text inside legacy Electronic Health Record systems.** NeuroFlo converts operative-note content into structured, trackable clinical, operational, and financial intelligence.
- **Replace Weeks-Long Manual Chart Audits With On-Demand Intelligence:** Hospital leadership can define what it wants to measure and use NeuroFlo to extract those variables from current or historical operative notes instead of manually reviewing charts to build the dataset.
- **Measure Surgical Performance at a Granular Level:** NeuroFlo turns operative-note data into real-time KPIs (Key Performance Indicators) for areas such as **physician efficiency, procedure duration, morbidity, outcomes, supply costs, compliance, and profitability by surgical subtype.**
- **Improve Clinical, Operational, and Financial Decision-Making:** NeuroFlo identifies efficiency gains across surgical teams, evaluates profitability by surgical subspecialty, and tracks outcomes and compliance measures that can support quality and risk improvement.

Problems Solved / Solutions Offered

- **Plain-Language Data Point Extraction:** Administrators and clinical leaders can describe what they want to track, such as surgical duration by surgeon or complication rates for a procedure, without first building the underlying dataset manually.
- **AI Variable Mapping:** NeuroFlo converts those requests into structured variables extracted across both historical and real-time operative notes.
- **No-Code KPI Creation:** Users can map extracted variables to the metrics, deltas, comparisons, and visualizations they want without requiring a custom analytics project for every new question.
- **Retroactive Data Mining:** NeuroFlo can query historical operative-note repositories to build new datasets and cohort analytics without manual chart review.
- **Continuous Surgical Intelligence:** Static operative reports become live, trackable metrics that can be analyzed across surgeons, procedures, specialties, teams, and departments rather than remaining isolated documents inside the Electronic Health Record.
- **Eliminate Manual Chart Audits:** NeuroFlo can extract granular surgical data directly from operative notes that would otherwise require expensive, time-consuming manual chart review. This is distinct enough from retroactive data mining because the value is specifically removing the manual audit burden.
- **Unlock Data Legacy EHR Analytics Cannot Access:** NeuroFlo extracts surgical nuance buried in unstructured operative-note text and converts it into structured, trackable variables that traditional Electronic Health Record reporting tools cannot easily analyze without manual review.
